Midterm Project- R Code and Outputs

Load in neccessary packages

```
library(tidymodels)
library(caret)
library(corrplot)
library(glmnet)
library(kableExtra)
library(earth)
```

Part I

Using this dataset, please help Researcher A build a prediction model for PFS, aiming to understand how demographic, tumor, and treatment characteristics influence progression-free survival in breast cancer patients.

To answer this question, your report should at least include the following:

Model Training: Provide a detailed description of the model training procedure and how you obtained the model. Your description should include sufficient detail so that another statistician can reproduce the same model. Points will be deducted if the details provided are insufficient to reproduce your results.

Import and partition data using 'tidymodels' package

```
load("data/datA.RData")

set.seed(2)

datA_split = initial_split(datA, prop = 0.8)

# Extract the training and test data
training_datA = training(datA_split)
testing_datA = testing(datA_split)

# Training data
x_trainA = model.matrix(log_PFS ~ . - id, training_datA)[, -1]
y_trainA = training_datA$log_PFS

# Test data
x_testA = model.matrix(log_PFS ~ . - id, testing_datA)[, -1]
y_testA = testing_datA$log_PFS

# Remove ID
```

```r
training_datA <- training_datA |>  select(-"id")
testing_datA  <- testing_datA  |> select(-"id")
```

Exploratory Data Analysis

```r
# Changing the plot display
theme1 <- trellis.par.get()
theme1$plot.symbol$col <- rgb(.2, .4, .2, .5)
theme1$plot.symbol$pch <- 16
theme1$plot.line$col <- rgb(.8, .1, .1, 1)
theme1$plot.line$lwd <- 2
theme1$strip.background$col <- rgb(.0, .2, .6, .2)
trellis.par.set(theme1)

# Feature plots to look at trends between predictors and the outcome (log_PFS)
featurePlot(x = training_datA[ ,c(1, 4, 5, 11)],
            y = training_datA[ ,16],
            plot = "scatter",
            span = .5,
            labels = c("Predictors","log_PFS"),
            type = c("p", "smooth"),
            layout = c(2, 2))
```

```r
# Calculates the correlation matrix for all the predictors
corrplot(cor(x_trainA), method = "circle", type = "full")
```

This data set includes 7 binary predictors, 3 categorical predictors, 5 continuous predictors, and 1 continuous outcome in log scale.

Chose elastic net because continuous variables formed a cloud, meaning we could assume linearity? homoscedasticity?

Correlation plot revealed that certain variables were highly correlated. Chose to address this with elastic net because we can address colinearity for [] and [] reasons

```r
# Elastic Net

ctrl1 <- trainControl(method = "cv", number = 10) # set up cv
set.seed(2) # set seed for reproduction

enet.fit <- train(log_PFS ~ .,
                  data = training_datA,
                  method = "glmnet",
                  tuneGrid = expand.grid(alpha = seq(0, 1, length = 21),
                                         lambda = exp(seq(-1, -7, length = 100))),
                  trControl = ctrl1)
```

```
## Warning in nominalTrainWorkflow(x = x, y = y, wts = weights, info = trainInfo,
## : There were missing values in resampled performance measures.
```

```r
enet.fit$bestTune
```

```
##      alpha     lambda
## 2045     1 0.01312373
```

```r
myCol <- rainbow(25)
myPar <- list(superpose.symbol = list(col = myCol),
superpose.line = list(col = myCol))

plot(enet.fit, par.settings = myPar, xTrans = log)
```

```r
# Coefficients in the final model
coef(enet.fit$finalModel, enet.fit$bestTune$lambda)
```

```
## 16 x 1 sparse Matrix of class "dgCMatrix"

Part II

About a decade later, Researcher B conducted a separate study enrolling 2000 breast cancer patients diagnosed between 2000 and 2005, using the same study design and variable definitions. Like Researcher A's study, all patients were followed until disease progression or death. Researcher B's data are stored in datB.RData. Researcher A would like to evaluate whether the prediction model built on the original data generalizes well to Researcher B's dataset. Does the model generalize well? If yes, provide justification. If not, build a new prediction model for the 2000–2005 cohort and discuss what has changed in prediction.

Import dataset and create matrix

```
load("data/datB.RData")

# Remove id for matrix operations
all_datB <- datB |> select(-"id")
```

Evaluate the model's performance on researcher B's dataset

```
# Use all of datB to test generalizability of elastic net model
enet_pred_B <- predict(enet.fit, newdata = all_datB)

# Compare performances
rmse_B <- RMSE(enet_pred_B, all_datB$log_PFS)

# Report table comparing performance
performance_table <- data.frame(
  Dataset = c("datA (Internal Test Set)", "datB (External Validation)"),
  RMSE = c(round(rmse_A, 4), round(rmse_B, 4))
)

colnames(performance_table) <- c("Dataset", "RMSE")

performance_table |>
  kable(caption = "Elastic Net Model Performance: Internal vs External Validation") |>
  kable_styling(full_width = FALSE)
```

Table 5: Elastic Net Model Performance: Internal vs External Validation

Dataset	RMSE
datA (Internal Test Set)	0.7470
datB (External Validation)	0.8356

Creation of New Model

Import and partition data using 'tidymodels' package

```
set.seed(2)

datB_split = initial_split(datB, prop = 0.8)

# Extract the training and test data
training_datB = training(datB_split)
testing_datB = testing(datB_split)

# Training data
```

```r
x_trainB = model.matrix(log_PFS ~ . - id, training_datB)[, -1]
y_trainB = training_datB$log_PFS

# Test data
x_testB  = model.matrix(log_PFS ~ . - id, testing_datB)[, -1]
y_testB = testing_datB$log_PFS

# Remove ID
training_datB <- training_datB |>  select(-"id")
testing_datB  <- testing_datB  |> select(-"id")
```

Exploratory Data Analysis

```r
# Feature plots to look at trends between predictors and the outcome (log_PFS)
featurePlot(x = training_datB[ ,c(1, 4, 5, 11)],
            y = training_datB[ ,16],
            plot = "scatter",
            span = .5,
            labels = c("Predictors","log_PFS"),
            type = c("p", "smooth"),
            layout = c(2, 2))
```

```r
# Calculates the correlation matrix for all the predictors
corrplot(cor(x_trainB), method = "circle", type = "full")
```

Elastic Net model

```r
# Elastic Net

ctrl1 <- trainControl(method = "cv", number = 10) # set up cv
set.seed(2) # set seed for reproduction

enet.test.b <- train(log_PFS ~ .,
                     data = training_datB,
                     method = "glmnet",
                     tuneGrid = expand.grid(alpha = seq(0, 1, length = 21),
                                            lambda = exp(seq(-1, -7, length = 100))),
                     trControl = ctrl1)
```
